

Technical Test

C# .NET Test

- You have been provided with a skeleton API project using FastEndpoints with one endpoint created.

Requirements

- Update the endpoint to
 - Call the following API: <https://jsonplaceholder.typicode.com/users>
 - Create a model (or models) to represent the response from the API
 - Serialize the API response to your new model
 - Filter the results to only include entries where the ID is greater than 3
 - Return the filtered response to the client

React Test

- You have been provided a skeleton react app (created with create-react-app).
- The app has the folder structure in place for atomic design and a button component already created for you
- The app is in a broken state.

Requirements

- Get the app compiling and rendering
- Update the app to:
 - Place a button on the page and call a function on button click to either
 - Call your .NET endpoint created in part 1
 - or
 - Call the following API: <https://jsonplaceholder.typicode.com/users>
 - Render the response from the API on the page
 - Create components (ideally using atomic design pattern) to model the response and render on screen
 - Add a text box to allow the user to filter users based on name. It should hide or display entries where the name matches
- Bonus points
 - Make it look pretty
 - Add tests
